

HYDRAULIC GEAR  
PUMPS AND  
MOTORS

**MAGNUM**<sup>®</sup>

## FEATURES

Modular design and versatility are the main features of “MAGNUM” series gear pumps and motors. Mounting flange, body and rear cover can be easily assembled to obtain multiple pumps of same or different groups available in standard version, common inlet or separated stages. Wide selection of drive shafts and mounting flanges in SAE version with the possibility of integrated outboard bearing to suit all the applications with axial and radial load on the drive shaft.

Port locations available in side or rear locations, and combination of side and rear locations. The low level of noise emission with the high volumetric and overall efficiencies ensure reliability and long working life in heavy duty applications.

### DISPLACEMENTS

From 1.05 in<sup>3</sup>/rev (17,28 cm<sup>3</sup>/rev)  
To 7.66 in<sup>3</sup>/rev (125,63 cm<sup>3</sup>/rev)

### PRESSURE

Max. continuous 4060 psi (280 bar)  
Max. intermittent 4350 psi (300 bar)  
Max. peak 4640 psi (320 bar)

### MAX. SPEED

3000 min<sup>-1</sup>

- Wide range of drive shafts and mounting flanges in SAE version
- More choices of port locations
- Integrated outboard bearing for heavy duty applications
- Multiple units available in standard version, common inlet and separated stages
- Exceptional working life expectancy

## FEATURES

Construction	External gear type pumps and motors
Mounting	SAE flanges
Line connections	Screw and flange
Direction of rotation (looking at the drive shaft)	Anti-clock (S) - clockwise (D) - reversible external drain (R) reversible internal drain (B)
Inlet pressure range for pumps	10 ÷ 44 psi - [0,7 ÷ 3 bar (abs.)]
Max back pressure for single rotation motors	$p_1$ (continuous) max 73 psi (5 bar)
	$p_2$ (for 20 s) max 116 psi (8 bar)
	$p_3$ (for 8 s) max 218 psi (15 bar)
Max drain line pressure on reversible rotation motors	73 psi (5 bar)
Max back pressure on the series motors	2175 psi (150 bar)
Fluid temperature range	See table (1)
Fluid	Mineral oil based hydraulic fluids to ISO/DIN and fire resistant fluids [see table (1)]. For other fluids please consult our technical sales department.
Viscosity range	From 60 to 456 SSU [12 to 100 mm <sup>2</sup> /s (cSt)] recommended
	Up to 3410 SSU [750 mm <sup>2</sup> /s (cSt)] permitted
Filtering requirement	See table (2)

Replaces: 01/07.2005

**Tab. 1**

Type	Fluid composition	Max pressure psi - (bar)	Max speed min <sup>-1</sup>	Temperature °F - (°C)			Seals (◆)
				Min	Max continuous	Max peak

## MULTIPLE PUMPS

MAGNUM series pumps can be coupled together in combination. Where input power requirement of each element varies, that with the greater requirement must be at the drive shaft end, and progressively smaller to the rear.

Features and performances are the same as the corresponding single pumps, but pressures must be limited by the transmissible torque of the drive and connecting shafts. To have appropriate data, use the formula below.

Replaces: 01/07.2005 The maximum rotational speed is that of the lowest rated speed of the single units incorporated.

Available with separated inlet, common inlet and separated stages.

Combination MAGNUM + KAPPA 20 series and MAGNUM + POLARIS 20 series are available with standard version and EM version with reduced dimensions for O.E.M.s.

For more information please consult our technical sales department.

For KAPPA 20 and POLARIS 20 series general data please consult the proper technical catalogues.

<b>M</b>	lbf in (Nm)	Torque
<b>V</b>	in <sup>3</sup> /rev (cm <sup>3</sup> /rev)	Displacement
<b>Δp</b>	psi (bar)	Pressure
$\eta_{hm} = \eta_{hm}(V, \Delta p, n)$	(≈ 0,90)	Hydro-mechanical efficiency

$$\begin{aligned}
 \text{O} \quad M &= \frac{M_{\text{theor.}}}{\eta_{hm}} \quad [\text{Nm}] \\
 M_{\text{theor.}} &= \frac{\Delta p \text{ (bar)} \cdot V \text{ (cm}^3\text{/rev)}}{62,83}
 \end{aligned}$$

**Note:** The torque absorbed from the shaft of the first pump results from the sum of the torques due to all single stages. The achieved value must not exceed the maximum torque limit given for the shaft of the first pump. Diagrams providing approximate selection data will be found on page 26.

O 02/06.2012

# ABSORBED TORQUE

## DRIVE SHAFT SELECTION

Let us consider a double pump HDP35•80 + HDP30•27. If we suppose that we have to work with the first pump at a pressure of 2900 psi (200 bar) and the second pump at a pressure of 2175 psi (150 bar), the graph 1 shows that the torque absorbed by HDP35•80 is 2523 lbf in (285 Nm) and the graph 2 shows that the torque absorbed by HDP30•27 is 620 lbf in (70 Nm) acceptable value because it doesn't exceed the maximum connecting shaft torque that is 1505 lbf in (170 Nm), see page 27. The torque to be transmitted by the first drive shaft will thus be 2523+620= 3143 lbf in (285+70= 355 Nm), this value must not exceed the shaft's maximum rated value.

## VERSIONS

For each version, the possible combination between drive shafts and mounting flanges are shown on pages 48 ÷ 50.

**0**

D0 10-D 11/0594

Version for applications without radial and axial load on the drive shaft.

**1**

D0 10-D 12/0594

Version for applications with low radial load and without axial load on the drive shaft.

**2**

D0 10-D 13/0594

Special version with independent shaft for applications with low radial load and without axial load on the drive shaft.

Max. torque version 2:  
HD. 30: 170 Nm (1505 lbf in)  
HD. 35: 350 Nm (3098 lbf in)

**3**

D0 10-138/0505

Version for applications with radial and axial load on the drive shaft.

Max. torque version 3:  
HD. 30: 170 Nm (1505 lbf in)  
HD. 35: 350 Nm (3098 lbf in)

**HD.30**

**4**

D0 10-D 14/0594

Version for applications with radial and axial load on the drive shaft.

Max. torque version 4:  
HD. 30: 170 Nm (1505 lbf in)

**HD.35**

**4**

D0 10-139/0505

Version for applications with radial and axial load on the drive shaft.

Max. torque version 4:  
HD. 35: 350 Nm (3098 lbf in)

01/07.2005

For the outboard bearings life expectancy, diagrams providing approximate selection data will be found on subsequent pages. For particular applications please consult our technical sales department.

**VERSION WITH OUTBOARD BEARING MAGNUM 30**

D010-143/0405

$X$  = Distance of the radial load result from the mounting flange [mm(in)].

Each curve has been obtained at:

Lubricant oil ISO VG 46

Temperature 140 °F (60 °C)

Without or with very low axial load

**Example**

Fr Radial load	1000 N (225.0 lbf)
X	30 mm (1.1811 in)
Speed	2000 min <sup>-1</sup>
Rating fatigue life	≈ 1915 h

01/07.2005

## CHANGING ROTATION

### Example of changing rotation: from HDP30 pump counterclockwise to clockwise

To change rotation of unidirectional pumps and motors is necessary to operate in the following way:

1. Clean the pump externally with care.
2. Loosen, and remove, the clamp bolts (1).

3. Coat the sharp edges of the drive shaft (4) with adhesive tape and smear a layer of clean grease on the shaft end extension to avoid damaging the lip of the shaft seal when removing the mounting flange.

4. Remove the mounting flange (2), taking care to keep the flange as straight as possible during removal. If the flange is stuck, tap around the edge with a fibre or rubber mallet in order to break away from the body. Ensure that while removing the front mounting flange, the drive shaft and other components remain position.

5. Ease the drive gear (4) up to facilitate removal the front plate (3), taking care that the precision ground surfaces do not become damaged, and remove the drive gear.

6. Remove the driven gear (5) without overturning. The rear plate has not to be removed.

7. Re-locate the driven gear (5) in the position previously occupied by the drive gear (4).

8. Re-locate the drive gear (4) in the position previously occupied by the driven gear (5).

9. Replace the front plate (3) in its original position.

10. Remove the grub screw (6) from the mounting flange (2) and re-locate it in the other threaded hole in the same flange.

11. Gently wipe the machined surface of the mounting flange (2) and the body with a flat hand stone.

12. Refit the front mounting flange (2) turned 180° from its original position.

13. Refit the clamp bolts (1) with the washers and tighten in a crisscross pattern to a torque value of 2230 ÷ 2726 lbf in (280<sup>±28</sup> Nm).

14. Check that the pump rotates freely when the drive shaft (4) is turned by hand. If not a pressure plate seal may be pinched.

15. The pump is ready for installation with the original rotation reversed.

01/07.2005

---

## INSTRUCTIONS

---

### INSTALLATION

#### Pump

The direction of rotation of single-rotation pumps must be the same as that of the drive shaft. Check that the coupling flange correctly aligns the transmission shaft and the pump shaft. Flexible couplings should be used (never rigid fittings) which will not generate an axial or radial load on the pump shaft.

#### Motor

The direction of rotation of single-rotation motors must match circuit connections. Check that the coupling flange correctly aligns the transmission shaft and the motor shaft. Flexible couplings should be used (never rigid fittings) which will not generate an axial or radial load on the motor shaft.

### TANK

Tank capacity must be sufficient for the system's operating conditions ( ~ 3 times the amount of oil in circulation) to avoid overheating of the fluid. A heat exchanger should be installed if necessary. The intake and return lines in the tank must be spaced apart (by inserting a vertical divider) to prevent the return-line oil from being taken up again immediately.

### LINES

The lines must have a major diameter which is at least as large as the diameter of pump or motor ports, and must be perfectly sealed. To reduce loss of power, the lines should be as short as possible, reducing the sources of hydraulic resistance (elbow, throttling, gate valves, etc.) to a minimum. A length of flexible tubing is recommended to reduce the transmission of vibrations. All return lines must end below the minimum oil level, to prevent foaming. Before connecting the lines, remove any plugs and make sure that the lines are perfectly clean.

### FILTERS

We recommend filtering the entire system flow. Filters on suction and return line must be fitted in according to the contamination class as indicated in the first pages of the catalogue. Casappa recommends to use its own production filters:

### HYDRAULIC FLUID

Use hydraulic fluid conforming to viscosity data as specified in the first pages of the catalogue. Avoid using mixtures of different oils which could result in decomposition and reduction of the oil's lubricating power.

### STARTING UP

Check that all circuit connections are tight and that the entire system is completely clean. Insert the oil in the tank, using a filter. Bleed the circuit to assist in filling. Set the pressure relief valves to the lowest possible setting. Turn on the system for a few moments at minimum speed, then bleed the circuit again and check the level of oil in the tank. In the difference between pump or motor temperature and fluid temperature exceeds 50°F (10 °C), rapidly switch the system on and off to heat it up gradually. Then gradually increase the pressure and speed of rotation until the pre-set operating levels as specified in the catalogue are attained.

### PERIODICAL CHECKS - MAINTENANCE

Keep the outside surface clean especially in the area of the drive shaft seal. In fact, abrasive powder can accelerate wear on the seal and cause leakage. Replace filters regularly to keep the fluid clean. The oil level must be checked and oil replaced periodically depending on the system's operating conditions.

## HOW TO ORDER SINGLE UNITS

Before ordering consult shaft, flange and version table compatibility at pages 48 ÷ 50.

## HOW TO ORDER DOUBLE PUMPS HDP... / KP20 O PLP20

01/07.2005

## HOW TO ORDER MULTIPLE UNITS HDP... / HDP

Before ordering consult shaft, flange and version table compatibility at pages 48 ÷ 50.

Omit code only if ordering complete multiple assembly

## MULTIPLE PUMPS ORDER EXAMPLE

Triple pump HDP 35 / 30 / 30 with common inlet between front and intermediate section.

### HOW TO ORDER SEPARATED SECTIONS

### HOW TO ORDER AN ASSEMBLED TRIPLE PUMP

01/07.2005

Our policy is one of continuous improvement in product. Specification of items may, therefore, be changed without notice.
