

PUMP DRIVES

PUMP DRIVES

CHARACTERISTICS

— The pump drives allow the contemporary running of two or more hydraulic pumps from a single prime mover.

All models can be prepared for various applications:

- basic (B) for independent mounting;
- with a overcenter industrial clutch (BD) (BDS);
- with housing and coupling connection for diesel engines.

Constructively the pump drives consist of:

- cast iron casing;
- straight-tooth gears, case hardened - hardened grinded (shaved in series AM 216 - AM 320);
- ball bearings;
- shafts in casehardening steel - case hardened - hardened.
- Viton seals on input shaft.

— The kinematic diagram is identical for the various models: the primary gear, which transmits, the drive to the secondary gears on whose axles the pumps are applied, is splined to the input shaft. The direction of rotation in output is the opposite to the rotation direction in input.

The transmission ratio is identical on all the outputs (AM 640 may have different ratios on outputs).

TECHNICAL DATA

— Ratio

It represents the ratio between the input speed (speed of the prime mover) and the output speed (speed of the pumps).

Ratios lower than 1 indicate a pump drive unit performing as speed increaser, higher than 1 as speed reducer.

— Max input torque M_1 (Nm)

It is the maximum torque which may be transmitted on input, corresponding to a theoretically unlimited gear life and to a bearing life (L10) of 10.000 hours at least.

For clutch coupled units, or when a RBD coupling is mounted, the max input torque may be limited by the clutch or the RBD torque capacity.

— Each output max torque M_2 (Nm)

It represents the maximum torque which may be transmitted on each output.

— Max speed n_1 (RPM)

It is the maximum rotation speed at the input shaft.

In case of clutch coupled unit, test that working speed is not more than the maximum permitted for the clutch.

— Moment of inertia J (Kgm²)

It is referred to the input shaft and it is calculated in accordance with ISO standards.

SELECTION

The fundamental elements on which the choice of pump drive is based are:

- 1) number and type of hydraulic pumps to be applied;
- 2) max torque absorbed by the pump (or by the group of pumps) on each output of the pump drive;
- 3) max power entering the pump drive.

- 1) Depending on the overall dimensions of the pumps, complete with pipes and pipe fittings, it is possible to establish the minimum distance between the pumps themselves. Comparing these values with the values foreseen in the catalogue for the out-put shafts, it is possible to make a choice of type.
- 2) Verify that the torque value of each output is kept below the max value shown in the catalogue for the chosen pump drive.
In cases of use in important industrial systems or in marine applications, it is necessary to bear in mind relevant safety factors.
Also verify that the rotation speed of input shaft isn't more than the max indicated in the catalogue.
In the case of pump drives with clutch BD or BDS verify that the max input torque is at least 20% below the max transmittable from the clutch.
- 3) Figure 1 shows the max input power advisable according to the pump drive model.

COOLING

Oil working temperature must not exceed 105°C.

Depending on the input power and on duty, a cooling system may be necessary.

It is advisable to check the oil temperature during the first hours of work, making sure that the oil doesn't exceed 105°C.

All pump drives, except for AM 216 and AM 320, can be equipped on request with a cooling system consisting of an oil circulating pump mounted on the input shaft, pumps side, an oil/water cooler and relevant pipe fittings.

DIESEL ENGINE CONNECTION

In cases of application to diesel engines, the pump drives can be supplied with housing and coupling suitable for engines with flywheel and flywheel housing dimensions according to SAE standards.

An example sketch of the dimensions to be checked is given in fig. 2.

The same dimensions are valid for connections with clutches.

The clutch pilot bearing (to assemble between the flywheel and the clutch shaft) is not included in the supply.

INSTALLATION

The working position of the pump drive is usually the one shown in the catalogue.

If other positions are requested it is necessary to confer with the technicians at Technodrive.

Special care must be taken over the fixing of the pump drive (see catalogue page 7).

LUBRICATION

Use gear lube oils with EP additive and minimum viscosity index of 95.

The oil choice may be made taking account of the ambient temperature, as per tab. 3.

The pump drives are supplied without oil.

Before use fill to the maximum level mark on dipsstick. The oil quantity indicated in the catalogue is approximate.

Oil must be replaced after the first 50 working hours. Subsequent oil changes should be made every 1.000 hours or every 12 months, whichever is the sooner.

Check regularly the oil level.

Oil working temperature must not exceed the 105°C.

ESEMPI DI INSTALLAZIONE

APPLICATION EXAMPLES

EXEMPLE D'INSTALLATION

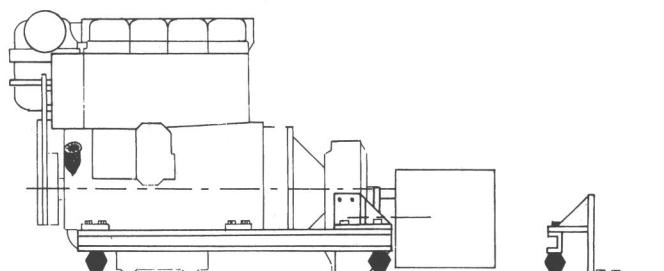

1

Applicazione AM con pompe di peso complessivo inferiore a 100 kg. Staffatura normale.

AM with pumps weight less than 100 kg. Normal stirrups.

Application AM avec pompes de poids total inférieur à 100 kg. Fixation normales.

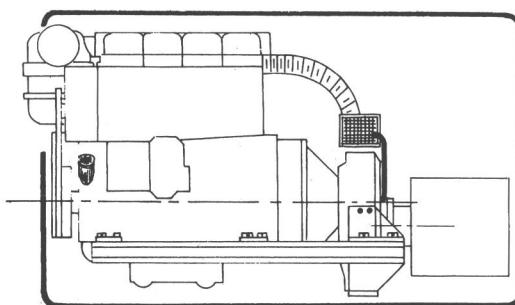

2

Applicazione AM con pompe di peso complessivo superiore a 100 kg. Le staffe devono essere il più vicino possibile al baricentro accoppiatore/pompe.

AM with pumps of total weight more than 100 kg. The stirrups must be closed to pump drive/pumps center of gravity.

Application AM avec pompes de poids total supérieur à 100 kg. Les fixations doivent être le plus près possible du centre de gravité AM + pompes.

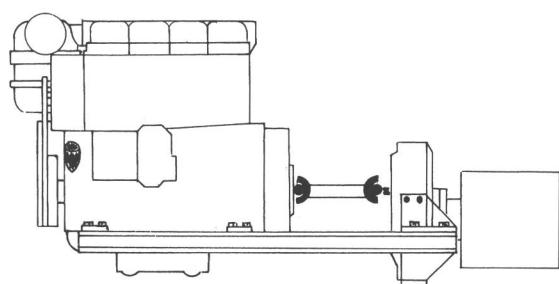

3

Applicazione AM in ambienti chiusi con scarsa aerazione. L'accoppiatore necessita di un impianto di raffreddamento.

AM in closed surrounding without ventilation. A cooling system is needed.

Application AM dans groupe insonorisé ou pièces close sans aeration. Il est nécessaire de prévoir un échangeur de température.

4

AM azionato da giunto cardanico. Le staffe devono essere applicate il più vicino possibile al baricentro accoppiatore/pompe.

AM driven by cardan joint. The stirrups must be closed to pump drive/pumps center of gravity.

Application AM avec entraînement cardan. Les fixations doivent être le plus près possible du centre de gravité AM + pompes.

N.B. - Per applicazioni particolari interpellare il nostro servizio tecnico. *For particular applications call our technical dept.* Pour applications particulières consulter notre bureau technique.
